### RECEIVED

### SEP 2 6 1995

#### Dear Sirs:

#### SOUTHBOROUGH BOARD OF HEALTH

Cullinan Engineering Co., Inc., at your request, has performed additional soil evaluations and percolation test at the Margaret Neary Elementary School. The purpose of this investigation was to investigate a specific area of the site where unofficial testing by others suggested that there may be acceptable soils to support subsurface sewage disposal.

Two test pits (E & F) were excavated in this general area during a previous general soils investigation conducted by us on January 3 and 4, 1995 which found high groundwater and dense sand and silt soils. No percolation testing was performed at that time due to the high groundwater encountered. The area investigated by this current testing is located on the northwestern portion of the property approximately 2200' north of the existing elementary school.

Three test pits and eight percolation pits were evaluated on August 16 & 17, 1995, using S.C.S. Soil Evaluation Methods (see attached soil logs). The testing was witnessed by Mr. Robert Kimball (Water Pollution Control Division, D.E.P.) and Mr. Paul Pisinski (Southboro B.O.H. Agent). Mr. Michael Sullivan and Mr. Robert DiPitrie, Jr., members of the School Building Committee, were present during a portion of the testing. Percolation Tests #3 and #4 had rates of 3 min./in. and 2 min./in., respectively. Perc Tests #1, #2, #5, and #6 failed to drop the initial 3" in 30 minutes, and overnight soaks were performed (310 CMR 15:105(6)). These holes were retested on August 17, 1995. The percolation test results for these four tests were 51 min./in., 12 min./in., 50 min./in. and 42 min./in., respectively. Percolation Tests #7 and #8 were run on August 17, 1995 and produced rates of less than 2 min./in.

In summary, percolation tests #2, 3, 4, 7 & 8 had acceptable (passing) percolation rates. Tests #1, 5 and 6 failed (over 30 min/in) for the percolation test. The percolation rates and the soil evaluation of the test pits suggests that there are quite variable conditions in the general area. The attached Figure #1 depicts the relative location of the testing that has been performed. The test holes have not been located by survey at this time, the locations are approximated only.

The preliminary test results suggest that a part of the tested area may be suitable for subsurface sewage disposal. Cullinan performed preliminary calculations for sizing a leach trench system based on the obtained percolation rates and for a 9,500 gal./day (475 student/faculty x 20 gal./day = 9,500 gal./day) absorption system. Figure #1 shows concept layout of such a system, it assumes 3' wide x 2' deep trenches with reserve area between

Ē

date

i al

active trenches. The sketch, as illustrated, provides 3,000 l.f. of trench. There is the possibility that additional deep soil holes and/or percolation tests may be necessary to verify that at least four feet of naturally occurring pervious material exist throughout the area proposed for the soil absorption system. To determine more definitely the acceptability of this area, Cullinan recommends the following:

- 1. Perform a topographic survey of the area; locate and obtain ground elevation of all the test holes; flag and locate all wetland resources; establish location of the property lines in this vicinity.
- 2. Based on the survey information, evaluate the concept design for the soil absorption system.
- 3. Perform additional testing as needed to verify acceptability of area under the proposed soil absorption system.
- 4. Obtain a written determination from the Department of Environmental Protection regarding an interpretation relating to Section 15.010 of the State Environmental Code, Title 5. The specific question relates to whether or not under the regulations that D.E.P. considers this a facility with the existing Margaret Neary Elementary School and a proposed Middle School, the combined estimated design sewage flow will be over 10,000 gpd. Section 15.010 (4) states "The Department or the approving authority, upon determining that ownership or control of the facilities asserted to be in separate ownership or control was arranged to circumvent the treatment or effluent standard requirements of 310 CMR 15.202 (recirculating sand filters) or 314 CMR 5.00 or 314 CMR 6.00 (groundwater discharge program), may order the owner or operator to consolidate the separate systems, to comply with the requirements of 310 CMR 15.202 (Recirculating Sand Filters), to obtain a groundwater discharge permit pursuant to 314 CMR 5.00 and 6.00, or to take any other action necessary to protect public health, safety, welfare or the environment."

The acceptability of this area for siting of a subsurface sewage disposal system to accommodate a new middle school is dependent on completion of the above items. It appears at this time that the site is rather marginal for subsurface sewage disposal, however, if properly proven out with survey and additional testing, it may be found to be acceptable.

 Parent Material (geologic)
 Depth to Bedrock: N/A

 Depth to Groundwater:
 None Obs.

 Standing Water in the Hole@ 108"
 Weeping from Pit Face: None Obs. @ 108"

 Estimated Seasonal High Ground Water: 34"

### **Determination for Seasonal High Water Table** TPC

#### Method Used:

Depth observed standing in observation hole inches

Depth weeping from side of observation hole inches

X Depth to soil mottles 34 inches

Ground water adjustment feet

 Index Well Number
 Reading Date
 Index well level

 Adjustment factor
 Adjusted ground water level

#### Depth of Naturally Occurring Pervious Material

Does at least four feet of naturally occurring pervious material exist in all areas observed throughout the area proposed for the soil absorption system?

Additional testing may be required to verify this after a preliminary design is developed.

If not, what is the depth of naturally occurring pervious material?

#### **Certification**

I certify that on 426/95 (date) I have passed the examination approved by the Department of Environmental Protection and that the above analysis was performed by me consistent with the required training, expertise and experience described in 310 CMR 15.017.
